

Code Review

Computing

What to look for, and what to leave to the linter.

Roughly in order of what matters.

Look for

Does it solve the actual problem?

Correctness at the edges — empty, null, huge

Security: input, auth, secrets

Is the failure mode safe?

Will the next reader understand it?

Leave to tooling

Formatting

Import order

Line length

Anything a linter can decide

How to say it

Ask, do not instruct

Separate 'must' from 'nice'

Praise good solutions explicitly

Approve with minor comments — do not block

Small pull requests get real reviews. A 2,000-line diff gets a rubber stamp, whatever the intention.
