DAY
16 hours

YEAR
165 Earth years

MOONS
16

- Winds reach 2,000 km/h — faster than anywhere else known.
- It was found by maths before anyone saw it.
- It has completed only one orbit since its discovery in 1846.
- Its moon Triton orbits backwards and has ice volcanoes.
- Sunlight there is about 900 times dimmer than here.

LOOK FOR IT

Needs a telescope. It has never been visible to the naked eye.

A "day" is one spin. A "year" is one trip round the Sun. On Neptune they are nothing like ours.
