

# Frog Life Cycle

Kindergarten

From egg to tadpole to frog — the change happens in water.

*A frog changes shape completely — that is metamorphosis, same as a butterfly.*

1

## EGGS

Frogspawn — hundreds of jelly eggs floating in a pond.

2

## TADPOLE

Hatches with a tail and gills. Swims and breathes underwater.

3

## BACK LEGS

Legs push out. Lungs start growing inside.

4

## FRONT LEGS

Front legs appear, and the tail begins to shrink.

5

## YOUNG FROG

Tail almost gone. It can now breathe air and hop onto land.

6

## ADULT FROG

Fully grown. It returns to the water to lay its own eggs.

It starts in water and ends able to live in both. Very few animals manage that.
